

Official Project Document - Version 1.0

HORUS Token Project

A Digital Token Built Around a Real Operating Project

HORUS does not begin with a token searching for a project. HORUS begins with a real project, then builds a supporting token around it.

First Operating Project

HORUS1 classified ads marketplace

Official Project Link

<https://horus1.com>

Core Model

Free access, low-cost optional services, and gradual expansion

Funding Discipline

10% initial operating release, 30% first phase, 70% participant allocation

Language: English

HORUS Crypto Website: <https://horuscrypto.com>

Document type: Project overview for GitHub and investor review

Document Purpose: This file explains the HORUS Token project as a token supported by a real marketplace execution layer, without presenting profit promises, ownership rights, or guaranteed returns.

1. Executive Introduction

In the digital asset market, most projects begin with the token first, then later try to build a use-case story around it.

The **HORUS** project starts from a different direction.

HORUS Token is not a token built on speculation alone, and it is not a project that relies only on promises or expectations. The project is based on a more realistic idea: building a digital token connected to a real operating ecosystem, beginning with its first practical project already in operation, the classified ads marketplace **HORUS1**.

HORUS1 is not just a future concept. It is an existing platform that can be visited through the link:

<https://horus1.com>

According to the project information, the platform is supported by an operating structure that includes a commercial entity, tax file, commercial registration, and active payment gateways, allowing it to operate as a real business project rather than merely a marketing interface for a digital token.

This is the core difference:

HORUS does not begin with a token searching for a project. HORUS begins with a real project, then builds a supporting token around it.

The first phase begins in Egypt by developing HORUS1 as a classified ads marketplace using traditional payment methods. The project may then expand later into selected large markets such as India and other international markets, with the possibility of activating HORUS Token utility in markets where this is legally permitted.

2. Central Idea

HORUS is built on a clear principle:

A real platform first, a supporting token second.

The token is not a replacement for the project. The token is not the main source of revenue. The token is not a promise of return.

The token is a future support layer that may serve a larger ecosystem built on:

- A real classified ads marketplace.
- Real users.
- Merchants and advertisers.
- Free ads across all categories.
- Low-cost optional services.

- Active payment gateways.
- A gradual international expansion plan.
- Optional token utility in legally permitted countries.

HORUS Logic Map

Operating Marketplace

HORUS1 begins with real listings, users, merchants, and traditional payments.

Low-Cost Optional Services

Free ads first, then affordable boosts, pinned ads, and merchant packages.

Token Utility Where Permitted

Optional HORUS Token discounts in compliant international markets.

3. Why HORUS Is Different

Many digital asset projects rely on one idea: launch a token, build a community, then wait for trading.

HORUS aims for a different model:

Element	Traditional Token Model	HORUS Model
Starting Point	Token first	Operating project first
Trust Source	Future promises	Existing platform and operating structure
Token Utility	Often unclear	Potential utility inside a marketplace
Platform Payments	Often absent	Active traditional payment gateways
Revenue Model	Often depends on trading	Low-cost optional advertising services
User Requirement	Often unclear	No forced payment or forced token use
Funding Plan	Often broad spending	Controlled spending starting with only 10%

4. HORUS1: The First Practical Project Inside the Ecosystem

HORUS1 represents the first practical project inside the HORUS ecosystem.

The platform aims to build a popular, scalable, low-cost classified ads marketplace that begins in Egypt and later expands to other markets after performance is measured.

HORUS1 is not based on forcing users or merchants to pay. On the contrary, the platform philosophy is based on adoption first, then offering optional services to users who want stronger visibility.

Core HORUS1 Model

- Free ads across different categories.
- The possibility of allowing a number of free ads, such as up to 10 ads, depending on each market policy.
- No forced subscription.
- No forced payment.
- No forced token use.
- Optional paid services only.
- Low-cost packages.
- Featured ads for users who want better visibility.
- Pinned ads at the top for users who need priority visibility.
- Merchant and business packages at suitable prices.

5. The Problem Targeted by the Platform

In many markets, individuals and merchants face recurring problems in digital advertising:

- High cost of paid advertising.
- Excessive dependence on social media platforms.
- Weak organization inside buying and selling groups.
- Difficulty for small merchants to appear against larger competitors.
- Weak trust between buyer and seller.
- Difficulty reaching the right local customer.
- Need for simple, low-cost tools for merchants.
- A financial barrier that prevents some users from advertising.

HORUS1 aims to address this problem through a popular, low-cost model that allows free entry, then adds optional services for better visibility.

6. Revenue Philosophy: Scale Before Price

HORUS1 does not depend on charging high prices to a limited number of customers.

The core philosophy is:

Free ads for everyone, and low-cost optional services for users who want stronger visibility.

This model aims to build a popular platform that can spread across multiple countries. As the number of users and merchants grows, the opportunity increases to convert a small portion of them into optional paid services.

Even if the subscription or service price is low, large scale may create a strong and recurring revenue model.

Non-binding illustrative example: if the platform succeeds in reaching large user numbers across several countries, low optional fees, even if only a few dollars per month, may become a meaningful income source because of the size of the user base.

This example does not represent a promise to achieve specific revenue. It only explains the growth logic based on scale and adoption.

7. The Role of HORUS Token Inside the Ecosystem

HORUS Token does not grant its holder ownership in HORUS1, shares, dividends, or any promise of financial return.

The role of the token is to serve as a future support layer for the ecosystem in markets where this is legally permitted.

In Egypt, HORUS1 operates as a classified ads marketplace using traditional payment methods only, and payment using HORUS Token is not activated in the first phase.

In international markets where this is legally permitted, HORUS Token may be activated as an optional payment method to receive discounts on selected platform services.

Examples of Potential Utility

- Discount on featured ads.
- Discount on pinned ads at the top.
- Discount on ad boosts.
- Discount on merchant packages.
- Discount on merchant pages.
- Discount on verification services.
- Discount on additional promotion tools.

In this way, the token gains a practical utility path inside the ecosystem without making any guarantees related to price or profit.

8. Egypt-First Strategy

HORUS begins in Egypt because the first phase aims to prove the platform model in a clear market, measure user and merchant behavior, and improve the product before international expansion.

During this phase:

- The platform operates through traditional payment methods.
- HORUS Token is not used as a payment method inside Egypt.
- The focus is on building a user base.
- Merchants and advertisers are acquired.
- The free and paid ads model is tested.

- Revenue and engagement are measured.
- The product is developed based on real data.

The success of Egypt is not measured by the token price. It is measured by real operating indicators, such as the number of ads, number of users, number of merchants, number of paid services, and platform return rate.

9. International Expansion

After the first phase, the project begins studying expansion into large international markets.

Potential future markets include:

- India.
- Selected Asian markets.
- Selected European markets.
- Arab and other international markets.

Country selection is not random. Expansion is based on several factors:

- Market size.
- Payment accessibility.
- User readiness for marketplaces.
- Marketing cost.
- Competition.
- Legal status of digital asset use.
- The project's ability to localize language and operations.

In countries where digital asset use is permitted, payment discounts using HORUS Token may be activated optionally.

10. Controlled Funding Model

HORUS does not present a model based on raising funds and using them all from the first day.

The proposed model is based on discipline:

- Only 30% of the funding value is allocated to support the development and operation of HORUS1 during the first 90 days.
- The first operating release does not exceed 10% of total funding.
- The remaining 20% of the project budget is used gradually according to development, marketing, and performance measurement stages.
- 70% is not an operating budget for the project, but is connected to presale participant allocation according to the defined unlock rules.

Initial Funding Structure

Item	Percentage of Total Funding
First operating release for the project	10%
Remaining project budget for the first 90 days	20%
Presale participant allocation	70%
Total	100%

This model shows that the project does not ask for open-ended trust. It begins with limited and controlled use, then proves execution through results.

11. Why Does the Project Start With Only 10%?

Starting with only 10% of total funding achieves several objectives:

- Reducing the risk of fund misuse.
- Demonstrating seriousness and financial discipline.
- Funding the first phase without consuming the full budget.
- Giving the project a chance to show real results before using the remaining operating allocation.
- Sending a trust message to participants that the team does not rely on random spending.

This 10% is used as an initial operating release to develop and improve the platform, prepare campaigns, improve user experience, and activate the first user and merchant acquisition stages.

The remaining 20% of the project allocation is used gradually according to work stages and results.

12. Early Participation Discount

A discount may be offered to presale participants, but it should be balanced.

A very large discount may create strong selling pressure after launch. Therefore, the most suitable model is:

- General early participation discount: 25%.
- Limited early discount for a small first tier: up to 30%.
- Preferably not exceeding 35%.

This discount does not mean a promised listing price or a promise of price growth. It is only an early participation discount.

13. Participant Token Unlock

If the presale platform allows only two token unlock stages, the proposed model is:

Stage	Unlock Percentage
At launch	25%
After 90 days	75%

This model gives participants initial liquidity while reducing sudden selling pressure and linking the largest unlock to the end of the first execution and operating period.

14. What Does the Participant Receive?

A presale participant does not receive a profit guarantee.

However, the participant receives:

- Early access to HORUS Token.
- Early participation discount.
- Clear unlock schedule.
- A real project supporting the token idea.
- Transparent token contract.
- Measurable operating plan.
- Controlled funding model.
- Progress reports that can be followed.

The project does not tell the participant: you will profit.

The project says:

Evaluate HORUS based on execution, transparency, platform growth, and clarity of fund use, not on price promises.

15. What Does a HORUS Token Holder Not Receive?

To prevent any misunderstanding, it must be clear that a HORUS Token holder does not receive:

- Ownership in HORUS1.
- Shares in the company.
- A share of platform revenue.
- Dividends.
- Guaranteed return.
- Promise of price growth.
- Liquidity guarantee.
- Guaranteed listing on an exchange.

HORUS Token is a supporting ecosystem token, not a share or investment contract that guarantees returns.

16. HORUS Token Contract Features

HORUS Token uses a simple and transparent contract model.

Key contract features include:

- No contract owner.
- No administrative privileges.
- No mint after launch.
- No burn function.
- No blacklist.
- No whitelist.
- No pause.
- No upgradeability.
- No proxy.
- No transfer taxes.
- No buy taxes.
- No sell taxes.
- No wallet limits.
- No transaction limits.
- No cooldown.
- No anti-bot logic.
- Based on OpenZeppelin ERC20.

These features increase transparency and predictability in how the contract works, but they do not mean profit is guaranteed or that all risks are removed.

17. First-Phase Success Indicators

The first phase is not measured by token price. It is measured by clear operating results.

Success indicators include:

- Number of active ads.
- Number of users.
- Number of merchants.
- Number of paid services.
- Number of visits.
- Number of contact actions.
- User return rate.

- User or merchant acquisition cost.
- Most active categories.
- Best-performing cities and governorates.

These indicators help evaluate the project as a real ecosystem, not only as a speculative token.

18. Project Message

The core HORUS message is:

We are not launching a token and then searching for a project. We have a real operating project, and we are building a supporting token around it that may be used in legally permitted markets.

HORUS begins from reality, not promises.

It begins from an existing platform, not just an idea.

It aims to build real token utility through adoption, optional services, discounts, and organized international expansion.

19. Disclaimer

This document is for informational and explanatory purposes only.

This document does not constitute financial, investment, legal, or tax advice.

The HORUS project does not guarantee profits, returns, token price growth, future liquidity, or listing on any exchange.

Participation in any project connected to digital assets involves high risk. Each participant must conduct their own research and comply with the laws applicable in their own country.

HORUS Token does not grant its holder ownership in HORUS1, nor any right to platform profits, revenue, or assets.
